8.7 Case Study

A case study is included describing a relative bioavailability study of PAHs in skeet target fragments that was performed using mice and will be used to adjust soil cleanup levels. The study was performed at a Formerly Used Defense Site where skeet target fragments remained in soils after closure of the former Air Force Base. A summary of the study and its results is provided at the link below, and further details on the methods used may be found in Appendix C ([PAH study methodology](#)).
